Transfer Learning

# Logistics and Agenda

- Logistics
  - Style Transfer Lab Due Soon
- Agenda
  - Transfer Learning Overview
  - Transfer Learning in Active Learning
- Next Time:
  - Paper Presentation: Lottery Ticket Hypothesis

# Transfer Learning Overview

Transfer learning be like

# Transfer Learning

- Transfer knowledge from a source prediction task to a target prediction task
  - without any regard for performing well on source task
- **Original:** Neural Information Processing 1995 (NeuRiPs)
  - Workshop on Learning to Learn
  - How to effectively retain and reuse previously learned knowledge
  - Originally used in markov chain and Bayesian networks (keeping n-grams, *etc.*)
  - **Key idea:** Humans can generalize what they learn to almost domain, can we mimic this behavior with ML?

## Ian Goodfellow's Definition:

*“Transfer learning refers to any situation where what has been learned in one setting is exploited to improve generalization in another setting.”*

# Transfer Learning: Large Umbrella

- Appears under a variety of names in the literature:
  - Learning to learn / Life-long learning
  - Knowledge transfer / Inductive transfer
  - Multi-task learning
  - Knowledge consolidation
  - Context-sensitive learning
  - Knowledge-based inductive bias
  - Meta learning
  - Incremental / Cumulative learning

# Precise Definition of Transfer Learning

$$X = x_1, x_2, \dots, x_N \in \mathcal{X}$$

$$Y = y_1, y_2, \dots, y_N \in \mathcal{Y}$$

$$\mathcal{D} = \{\mathcal{X}, p(X)\}$$

Domain      Feature Space      Probability Observation

$$\mathcal{T} = \{\mathcal{Y}, p(Y|X)\}$$

Task      Label Space      Learned Probability

- $\mathcal{D}$  Domain defines the features used and probability
- $\mathcal{X}$  is the space of all possible features
- $p(X)$  is probability of observing specific instances in  $\mathcal{X}$ 
  - Typically **intractable** to calculate (generative)
- $\mathcal{T}$  Task is within a domain, defining labels and model
- $\mathcal{Y}$  is space of all possible labels
- $p(Y|X)$  probability of observing specific label given the specific feature:
  - **Not** intractable (discriminative)

# Definition with Examples

$$X = x_1, x_2, \dots, x_N \in \mathcal{X}$$

$$Y = y_1, y_2, \dots, y_N \in \mathcal{Y}$$

$$\mathcal{D} = \{\mathcal{X}, p(X)\}$$

Domain	Feature Space	Probability Observation
--------	---------------	-------------------------

- Image Pixels
- Sensor Readings
- Natural Language
- *Almost anything that we can represent as a feature*

$$\mathcal{T} = \{\mathcal{Y}, p(Y|X)\}$$

Task	Label Space	Learned Probability
------	-------------	---------------------

- Object Classification
- Dolphin/Shark Classification
- Sentiment Analysis
- *Any labeled task for which we might be able to build a classifier*

# Transfer Learning

$$X = x_1, x_2, \dots, x_N \in \mathcal{X}$$

$$Y = y_1, y_2, \dots, y_N \in \mathcal{Y}$$

$$\mathcal{D} = \{\mathcal{X}, p(X)\}$$

$$\mathcal{T} = \{\mathcal{Y}, p(Y|X)\}$$

Domain      Feature Space      Probability Observation

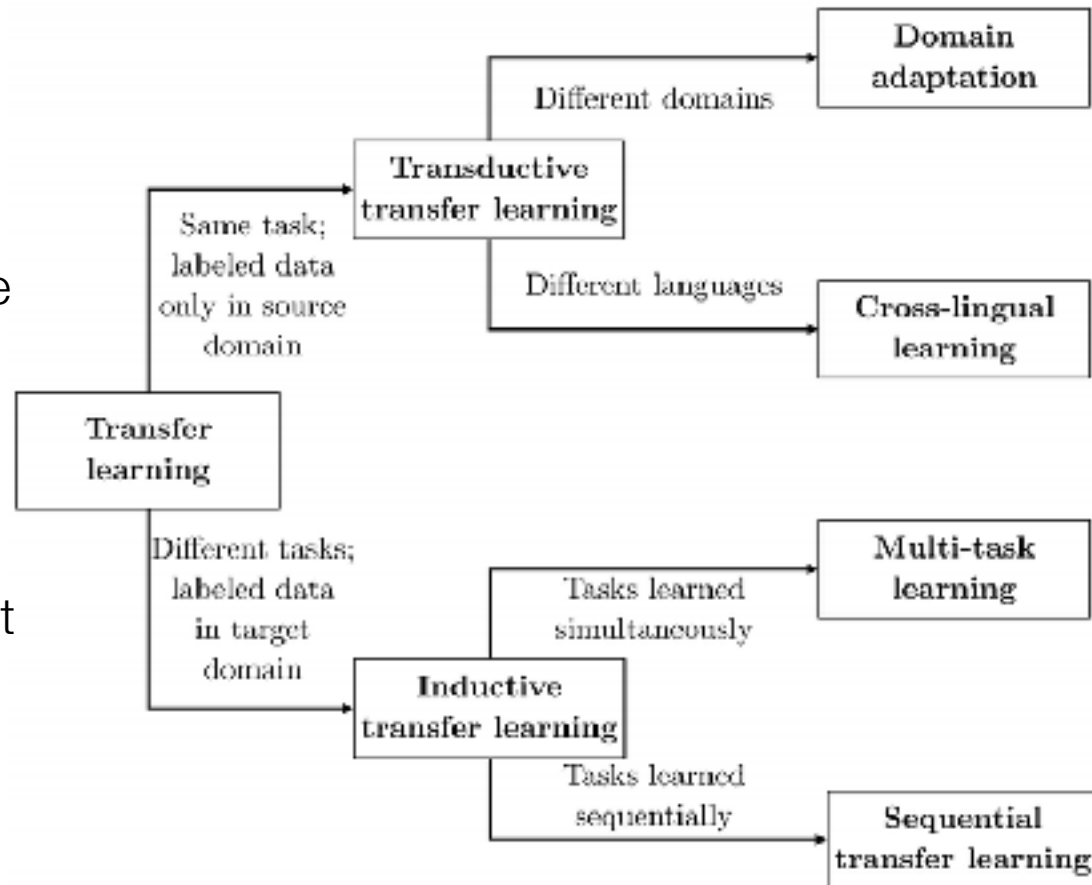

Task      Label Space      Learned Probability

- Need to translate document Source to Target  $\mathcal{T}_S \rightarrow \mathcal{T}_T$
- Variety of differences might be present. For example, in the context of document classification:
  - **Feature space:** different languages  $\mathcal{X}_S \neq \mathcal{X}_T$
  - **Marginals:** same language, same label space, but differing topics  $p(X_S) \neq p(X_T)$
  - **Conditional:** different label distributions or possibly different labels  $p(Y_S|X_S) \neq p(Y_T|X_T)$

# Categories of Transfer Learning

- **Inductive:** Same Domain, Different Task
  - Using pre-trained VGG as basis for classifying dolphins versus sharks, Style Transfer, sentiment analysis from Glove
- **Transductive:** Different (but related) Domains, Same Task
  - Place identification from RGB Images or LIDAR
- **Unsupervised Transfer:** Different Domains, Different Tasks
  - Learning to paint art and learning to be a surgeon
  - Not yet a field with much repeatable traction

# Aside: Other categorizations

	Training	Testing
Transfer Learning	Task 1	Task 2
Multi-task Learning	Task 1 ... Task N	Task 1 ... Task N
Lifelong Learning	Task 1 ... Task N	Task N+1

Humans can learn to ride a bike and use that to understand better about driving a car. Machine Learning in its current form is far from this capability. How can we move our siloed version of artificial intelligence closer to the process of human based learning? How can we accumulate knowledge from model to model?

Does biology of human learning hold any clues to success? How does a human learn to crawl? To talk? To ride a bike? What is a human's motivation to learn?

# Transfer Learning with Neural Networks

Found in a recent paper:

## **6 Unrelated Work**

This paper is not related to [8, 23, 48, 13, 35] in any way, but we think everyone should read these papers because: (1) they're real good, (2) my friends also need those citations.

## **7 Related Work**

# Deep Transfer Learning

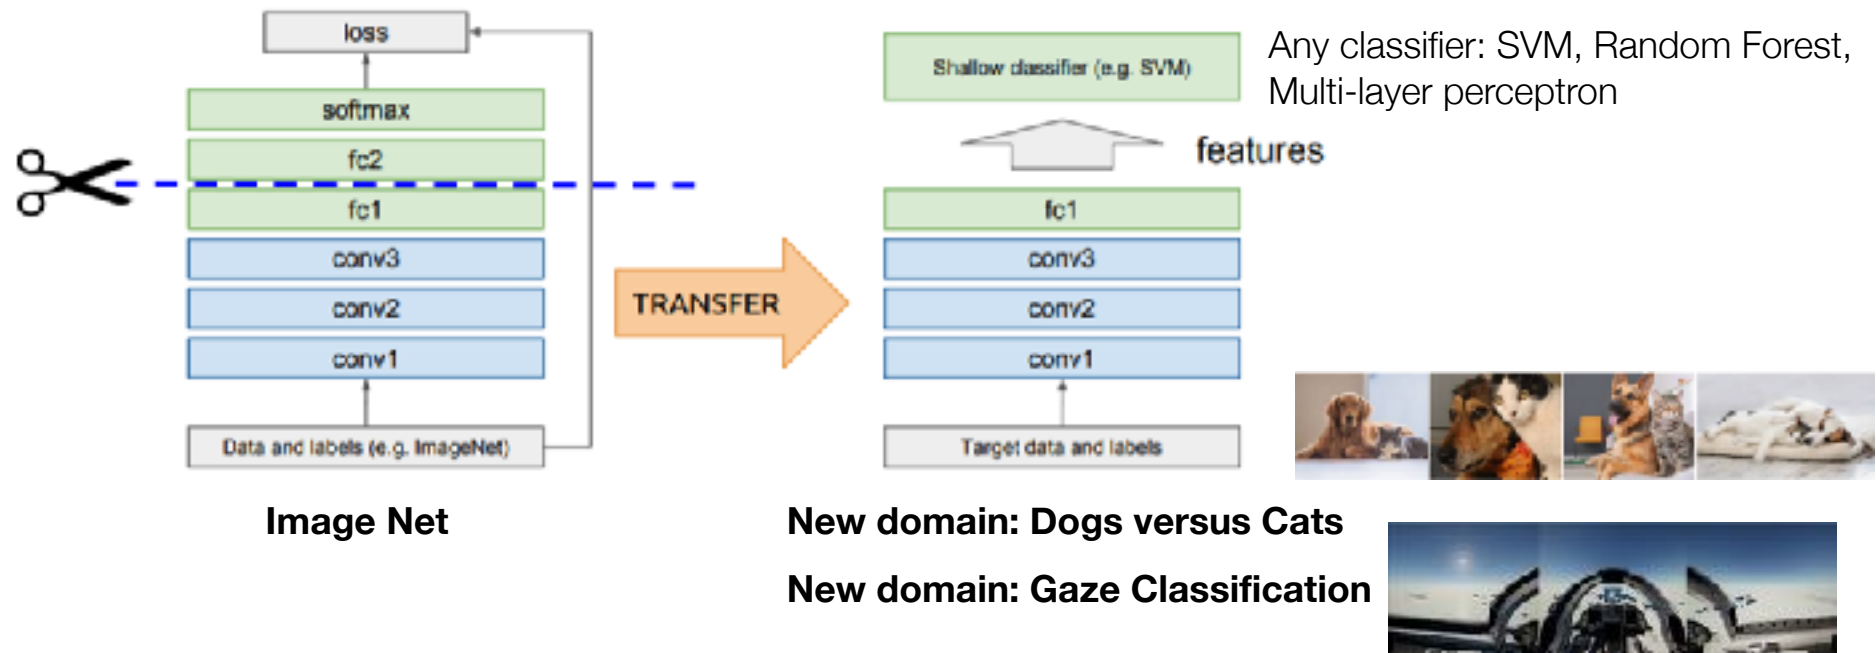

- Almost always **Inductive Transfer**
  - (new task , same domain)
- Almost always **Feature Representation Transfer**
  - like image pre-training
- All other topics are open research topics that maybe one of you will solve!

# Approaches with Deep Learning

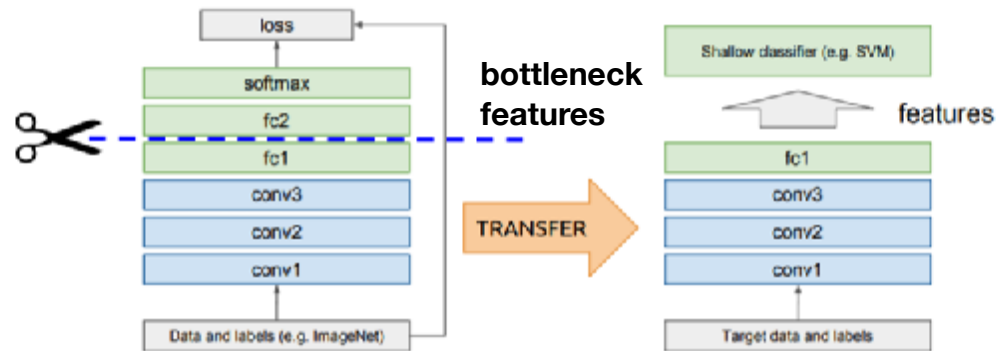

- **Feature Extraction Transfer**

- Most well known: use learned parameters from one task in another task in same domain
- Most useful when labels for target domain are sparse

# Defining the Bottleneck

- Frozen training layers before bottleneck:
  - Why waste computations?
  - Computing more than one forward pass on the same data—just save them out
  - *Unless* using augmentation
- In Keras, build multiple models with different entry points

- **Input to Bottleneck**

```
inputs = Input(shape=(IMG_SIZE, IMG_SIZE, 3))
model_base = VGG(include_top=False,
                  input_tensor=inputs, weights="imagenet")
```

- **Bottleneck to Output**

```
bottleneck = Input(shape=model_base.output.shape)
outputs = Dense(NUM_CLASSES)(bottleneck)
model_top = Model(bottleneck, outputs)
```

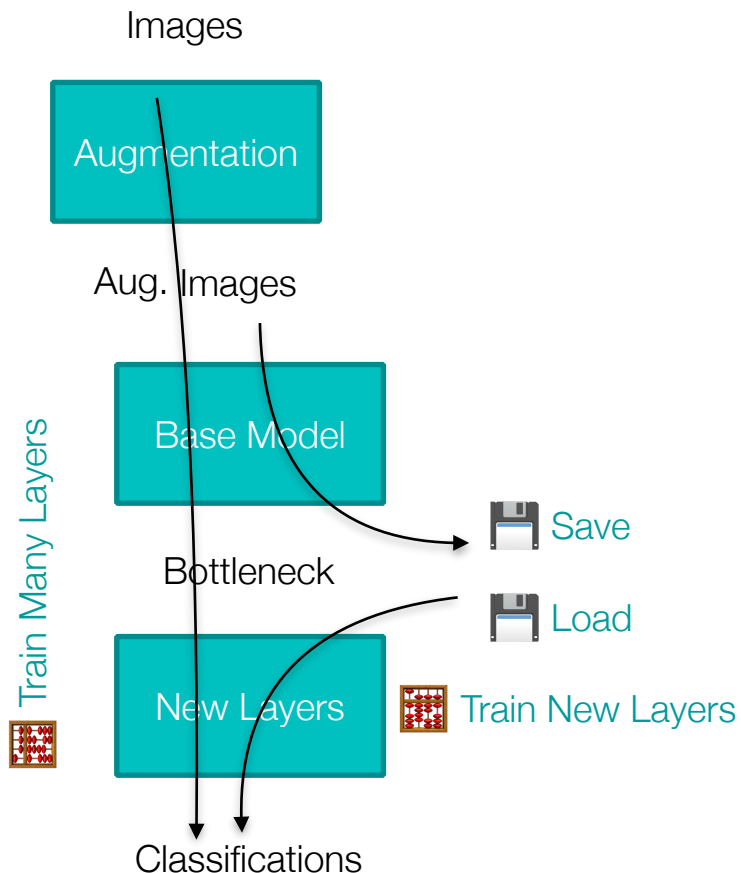

- **Input to Output**

```
model_total = Model(inputs, outputs)
```

# Freezing and Fine-tuning

- Step 1, Freeze base model:
  - No update during back-propagation
  - Only update layers after the bottleneck
  - Optional: Augment a set of training data
  - Send training dataset through base model
    - ◆ Save out bottleneck features
  - Train bottleneck features in new task
    - ◆ Typically 5-10 epochs is sufficient, easy to overfit
    - ◆ Larger training step size is okay
- Step 2, Fine-tune, unfreeze a few layers in base model:
  - Setup images to use some type of augmentation
  - Attach newly trained model to pre-trained model
  - Train to your hearts content, use smaller training step size

# Popular Transfer Learning Models

- **Vision:**
  - ImageNet Architectures:
    - ◆ VGG, Inception, ResNet, Xception, EfficientNet
- **Audio:**
  - WaveNet, almost always WaveNet
- **Text:**
  - Word Embedding
    - ◆ Glove, Word2Vec, ConceptNet
  - Sentence Embedding
    - ◆ Universal Sentence Encoders (Google)
    - ◆ BERT (Google)
    - ◆ Skip-thought Vectors
- **From the Research my Students have done:**
  - VGG for transferring to gaze classification
  - VGG for swapped face detection
  - Emotion recognition for prosody classification
  - YOLO/DarkNet for surgical instrument detection
  - GLOVE for similar instructions in a maintenance manual
