## Need a new formulation

$$\log p(x)_{\forall i} \approx \mathbf{E}_{\mathbf{z} \leftarrow q(z|x)} \left[ \log p(x^{(i)}) \right]$$
 Maximize!

$$= \mathbf{E}_q \begin{bmatrix} \log \frac{p(x^{(i)} \mid z) p(z)}{p(z \mid x^{(i)})} \frac{q(z \mid x^{(i)})}{q(z \mid x^{(i)})} \end{bmatrix}$$
 Variational + multiply by one 
$$p(z \mid x^{(i)}) \text{ this is still a problem}$$

$$\begin{split} &= \mathbf{E}_{q} \left[ \log p(x^{(i)} | z) \right] + \mathbf{E}_{q} \left[ \log \frac{p(z)}{q(z | x^{(i)})} \right] + \mathbf{E}_{q} \left[ \log \frac{q(z | x^{(i)})}{p(z | x^{(i)})} \right] \\ &= \mathbf{E}_{q} \left[ \log p(x^{(i)} | z) \right] - \mathbf{E}_{q} \left[ \log \frac{q(z | x^{(i)})}{p(z)} \right] + \mathbf{E}_{q} \left[ \log \frac{q(z | x^{(i)})}{p(z | x^{(i)})} \right] \\ &= \mathbf{E}_{q} \left[ \log p(x^{(i)} | z) \right] - D_{KL} \left[ q(z | x^{(i)}) || p(z) \right] + D_{KL} \left[ q(z | x^{(i)}) || p(z | x^{(i)}) \right] \end{split}$$

 $\log p(x)_{\forall i} \geq \mathbf{E}_q \left[\log p(x^{(i)} | z)\right] - D_{KL} \left[q(z | x^{(i)}) \| p(z)\right] \text{ Will Maximize Lower Bound}$ 

### Can we motivate this in a different way?

## The Loss Function

Maximize through Error of Reconstruction Same as minimizing cross entropy want p(z) to be  $\mathcal{N}(\mu=0,\Sigma=I)$ because it makes nice latent space

$$q(z \mid x^{(i)}) \to (\mu_{z\mid x}, \Sigma_{z\mid x}) \quad p(z) \to \mathcal{N}(0,1)$$

$$D_{KL}\left((\mu,\Sigma)\|\mathcal{N}(0,1)\right) = \frac{1}{2}\left(\mathrm{tr}(\Sigma) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma)\right)\right) \\ \text{Can get this by manipulating the KL for normal distribution} \\ \text{Determinant of diagonal matrix is simple.} \\ \text{Motivates diagonal covariance...} \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma)\right) \\ \text{Motivates diagonal covariance...} \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma)\right) \\ \text{Motivates diagonal covariance...} \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma\right)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma\right)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma\right)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma\right)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma\right)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma\right)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma\right)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma\right)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma\right)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma\right)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma\right)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma\right)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma\right)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma\right)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma\right)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma\right)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma\right)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma\right)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma\right)\right) \\ \text{Tr}\left(\Sigma\right) + \mu \cdot \mu^T - \underline{k} - \log\left(\det(\Sigma\right)\right)$$

$$= \frac{1}{2} \left( \sum_{k} \Sigma_{k,k} + \sum_{k} \mu_k^2 - \sum_{k} 1 - \log \left( \prod_{k} \Sigma_{k,k} \right) \right)$$

$$\geq \mathbf{E}_{q(z|x^{(i)})} \left[ \log p(\widehat{x}^{(i)}|\widehat{z}_{k}) \right] \sum_{k} \sum_{k} \mu_{k}^{2} - \sum_{k} 1 - \sum_{k} \log \Sigma_{k,k}$$

$$= \frac{1}{2} \sum_{k} \left( \sum_{k,k} + \mu_{k}^{2} - 1 - \log \Sigma_{k,k} \right)$$

$$= \frac{1}{2} \sum_{k} \left( \sum_{k,k} + \mu_{k}^{2} - 1 - \log \Sigma_{k,k} \right)$$

# The Covariance Output

$$\geq \mathbf{E}_{q(z|x^{(i)})} \left[ \log p(x^{(i)}|z) \right] - D_{KL} \left[ q(z|x^{(i)}) || p(z) \right]$$

Maximize through
Error of Reconstruction
Same as minimizing cross entropy

want p(z) to be  $\mathcal{N}(\mu=0,\Sigma=I)$  because it makes nice latent space  $q(z\,|\,x^{(i)}) \to (\mu_{z|x},\Sigma_{z|x}) \quad p(z) \to \mathcal{N}(0,1)$ 

$$\log \Sigma_{k,k} = \widehat{\Sigma_{k,k}}$$

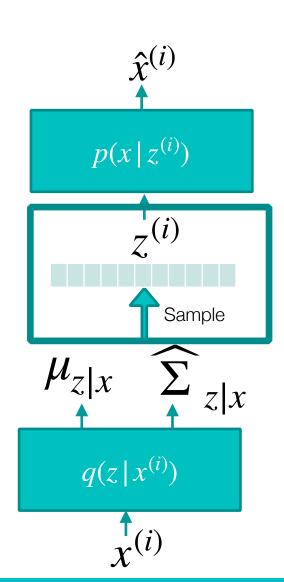

$$\log \sum_{k,k} = \widehat{\Sigma_{k,k}}$$

$$\log z_{k,k} = \frac{1}{2} \sum_{k} \left( \exp \left( \widehat{\Sigma_{k,k}} \right) + \mu_k^2 - 1 - \widehat{\Sigma_{k,k}} \right)$$

so we will have the neural network output log variance

Also, remember we assume **diagonal covariance**, so z's are not correlated This means covariance is only a vector of variances (the diagonal of  $\Sigma$ )

$$\geq \mathbf{E}_{q(z|x^{(i)})} \left[ \log p(x^{(i)}|z) \right] - D_{KL} \left[ q(z|x^{(i)}) || p(z) \right]$$

This is partially differentiable by chain rule...

$$\begin{split} \mathcal{N}(\mu_{z|x}, \exp(\widehat{\Sigma_{z|x}})) &= z \\ &= \mu(x^{(i)}) + \exp(\widehat{\Sigma(x^{(i)})}) \cdot \mathcal{N}(0, 1) \end{split}$$

To update q, we need to back propagate through sampling layer. How?

# The Loss Function Implementation

```
# Encode the input into a mean and variance parameter
z mean, z log variance = encoder(input img)
 \mu(x^{(i)}) \Sigma(x^{(i)})
# Draw a latent point using a small random epsilon
z = z mean + exp(z log variance) * epsilon
                                                     z = \mu(x^{(i)}) + \exp(\Sigma(x^{(i)})) \cdot \mathcal{N}(0,1)
# Then decode z back to an image
reconstructed img = decoder(z)
                      \hat{x}^{(i)} = p(x^{(i)} \mid z)
# Instantiate a model
model = Model(input img, reconstructed img)
def vae loss(self, x, z decoded):
     x = K.flatten(x)
     z decoded = K.flatten(z_decoded)
     xent_loss = keras.metrics.binary_crossentropy(x, z_decoded) -\mathbf{E}_{q(z|x^{(i)})} \left| \log p(x^{(i)}|z) \right|
     kl loss = -5e-4 * K.mean(
          1 + z log var - K.square(z mean) - K.exp(z log var), axis=-1)
     return K.mean(xent loss + kl loss)
                                                    -\lambda \sum_{i} 1 + \widehat{\Sigma}(x^{(i)}) - \mu(x^{(i)})^2 - \exp(\widehat{\Sigma}(x^{(i)}))
   Note:
```

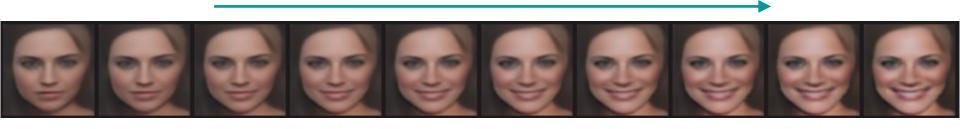

Flipped from maximization to minimization and added lambda for tradeoff in reconstruction, normal latent space

$$= -\mathbf{E}_{q(z|x^{(i)})} \left[ \log p(x^{(i)}|z) \right] - \lambda \sum_{k} 1 + \widehat{\Sigma(x^{(i)})} - \mu(x^{(i)})^2 - \exp(\widehat{\Sigma(x^{(i)})})$$
22

## Now that its trained, so what?

Encoding faces, then adjust the "z" that relates to smiling.

Investigate what happens by moving around each  $z_i$ 

$$\chi^{(i)} \rightarrow \boxed{\begin{array}{c} \mu_{z|x} \\ q(z|x^{(i)}) \\ + \sum_{z|x} \end{array}} \qquad \qquad \chi^{(i)} \qquad \qquad \chi^{(i$$

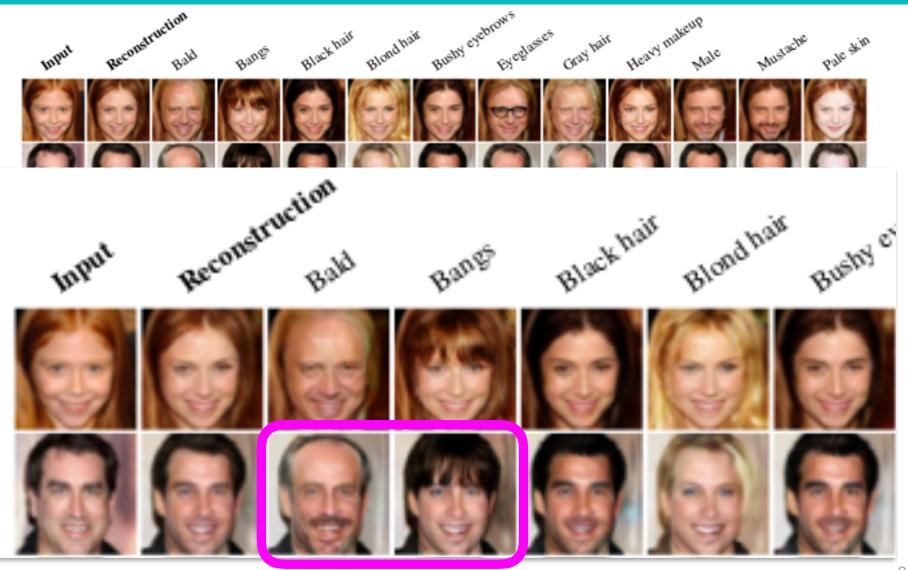

# **VAE Examples**

Encoding faces, then adjust the "z" that relates to smiling.

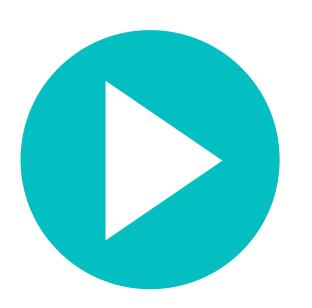

# VAE Examples

Different, automatically found z, latent variables

## **VAEs in Keras**

Sampling from variational auto encoder

using MNIST
