**Error Rates** 

## Contrastive Loss

**4**1 ····

DeepSeek [1] uses elements of the 2015 reinforcement learning prompt engineer [2] and its 2018 refinement [3] which collapses the RL machine and world model of [2] into a single ret through the neural net distillation procedure of 1991 [4]: a distilled chain of thought system.

REFERENCES (easy to find on the web):

 #DeepSeekR1 (2025): Incentivizing Reasoning Capability in LLMs via Reinforcement Learning. arXiv 2501.12948

[2] J. Schmidhuber (JS, 2015). On Learning to Think: Algorithmic Information Theory for Novel Combinations of Reinforcement Learning Controllers and Recurrent Neural World Models. arXiv 1210.0118. Sec. 5.3 describes the reinforcement learning (RL) prompt engineer which learns to actively and iteratively query its model for abstract reasoning and planning and decision making.

[3] JS (2018). One Big Net For Everything, arXiv 1802.08864. See also US1185388682. This paper collapses the reinforcement learner and the world model of [2] (e.g., a foundation model) into a single network, using the neural network distillation procedure of 1991 [4]. Essentially what's now called an RL "Chain of Thought" system, where subsequent improvements are continually distilled into a single net. See also [5].

#### **Dealing with Data Sparsity**

$$\mathcal{L}_{ce}(y,\hat{y}) = -\sum_{i \in L} p(y^{(i)} = c) \cdot \log \left( p_{\theta}(\hat{y}^{(i)} = c \mid \mathbf{x}^{(i)}) \right)$$

- **Problem**: When we have a limited number of labeled samples, L, there are also a limited number of gradient updates
  - Can we boost gradient updates existing labeled data, perhaps even exponentially?
  - Can latent space distances be made meaningful?

#### Contrastive Loss:

- Use a metric to measure similarity of samples within latent space (e.g., cosine distance, euclidean, etc.),
- Randomly sample from two or more classes
- Push same classes together
- Push different classes apart (within a threshold)

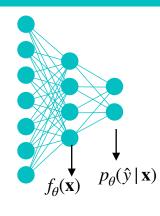

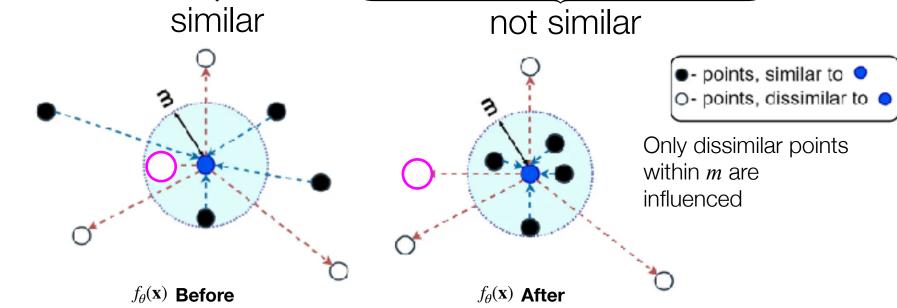

#### **Contrastive loss**

Latent representations of  $\mathbf{x}$ , from model f

$$D(\mathbf{x}^{(i)}, \mathbf{x}^{(j)}) = \|f_{\theta}(\mathbf{x}^{(i)}) - f_{\theta}(\mathbf{x}^{(j)})\|_{2}$$

$$\mathcal{L}_c = \sum_{i,j \in S} D(\mathbf{x}^{(i)}, \mathbf{x}^{(j)}) + \sum_{i,j \in \hat{S}} \max \left(0, m - D(\mathbf{x}^{(i)}, \mathbf{x}^{(j)})\right)$$

https://medium.com/@maksym.bekuzarov/losses-explained-contrastive-loss-f8f57fe32246

#### Contrastive loss in Face Detect/Identify

Contrastive Loss great for authenticating without re-training

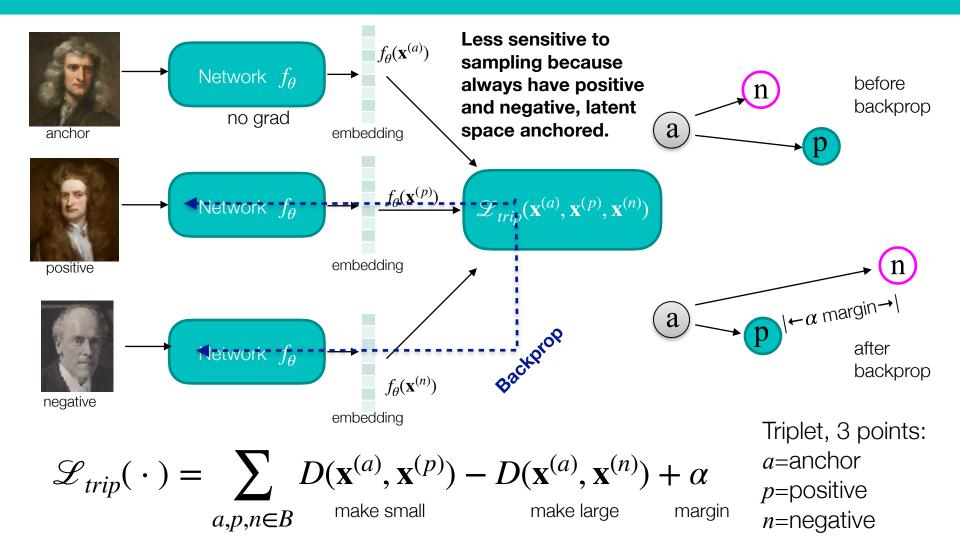

However, the training pairs chosen for positive and negative samples tends to be sensitive to sampling for good performance.

Traditional ML

Contrastive Model

127

## Triplet Loss, $\mathcal{L}_{trip}$ , More Stable than $\mathcal{L}_c$

Schroff et al. FaceNet: ..., 2015, https://arxiv.org/pdf/1503.03832

$$D(\mathbf{x}^{(i)}, \mathbf{x}^{(j)}) = \|f_{\theta}(\mathbf{x}^{(i)}) - f_{\theta}(\mathbf{x}^{(j)})\|_{2}$$

128

#### More on Triplet Loss

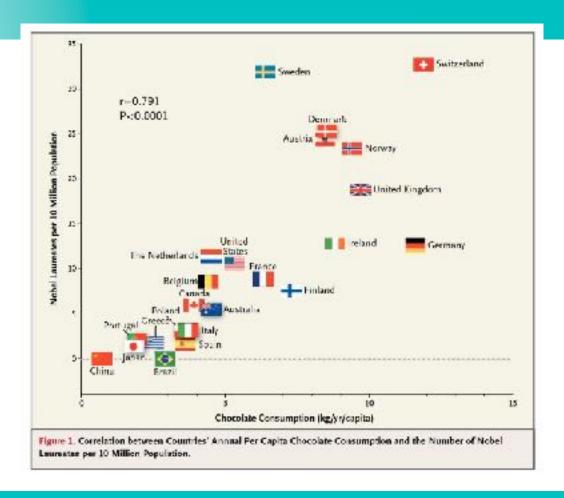

#### Triplet Mining:

- Want "hard" triplet, or results might not be optimal
- Finding the hardest examples is also hard, requiring exhaustive search
- Online triplet (opportunistic): if a hard example comes up, add it to hard list

Table 3. Comparison with the state-of-art on the cars-196 and Stanford products.

## Multi-modal Review

#### Multi-modal == Multiple Data Sources

- Modal comes from the "sensor fusion" definition from Lahat, Adali, and Jutten (2015) for deep learning
- Using the Keras functional API, this is extremely easy to implement
  - ... and we have used it since CS7324!
- But now let's take a deeper dive and ask:
  - What are the different types of modalities that we might try?
  - Is there a more optimal way to merge information?
  - When? Early, Intermediate, and late fusion

#### Early and Late Stage Fusion

- Early Fusion: Merge sensor layers early in the process
- Assumption: there is some data redundancy, but modes are conditionally dependent
- Problem: architecture parameter explosion
  - Typically need dimensionality reduction
  - Output

    Model

    Data Fusion

    Cata Fusion

    PCA

    PCA

    PCA

    Modality 1

    Modality 2

    Modality K

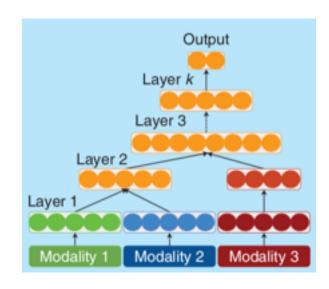

- Late Fusion: Merge sensor layers right before flattening
- Use Decision Fusion on outputs
- Assumption: little redundancy or conditional independence—just an ensemble architecture
- Problem: just separate classifiers, limited interplay

#### Intermediate Fusion

- Merge sensor layers in soft way
- Assumption: some features interplay and others do not
- Problem: how to optimally tie layers together?
  - 1. Stacked Auto-Encoders [Ding and Tao, 2015]
  - 2. Early fuse layers that are correlated [Neverova et al. 2016]
  - 3. Fully train each modality merge based on criterion of similarity in activations [Lu and Xu 2018]
  - 4. Granger Cluster data in each modality and combine [Sylvester et al. 2023]

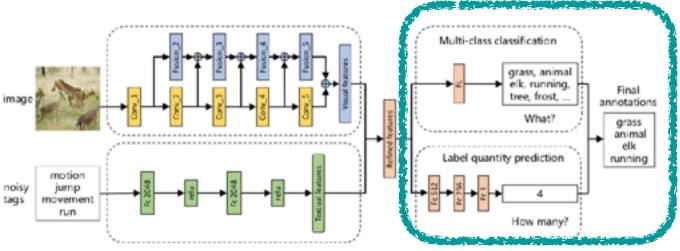

Ramamchandran and Taylor, 2017

133

#### Multi-modal Merging

- Still an open research problem
- How to develop merging techniques that
  - Can handle exponentially many pairs of modalities
  - Automatically merge meaningful modes
  - Discard poor pairings
  - Selectively merge early or late (or dynamically)

Most current methods are still ad-hoc

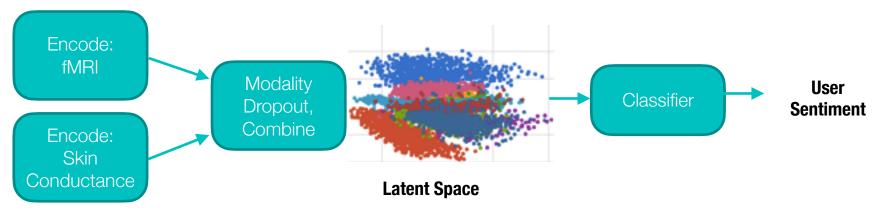

https://arxiv.org/pdf/1709.01220.pdf

134

#### **Approaches with Deep Learning**

- Latent Space Transfer (universality)
  - From another domain, map to a similar latent space for the same task
  - Useful for unifying data based upon a new input mode when old mode is well understood
    - for example, biometric data
    - 2019-2023, I have never seen a research paper on this...

#### **Currently in Review**

 $X \in \mathbb{R}^{T \times C_f \times C_s}$ : The input for a single modality  $Y = \text{FFN}_{\text{subchannel}}(X) \in \mathbb{R}^{T \times C_f \times C_{ds}}$ : Maps each subchannel to a latent space of higher dimension.  $Z = \text{FFN}_{\text{channel}}(Y) \in \mathbb{R}^{T \times C_{dm} \times C_{ds}}$ : Reduces dimension-

 $Z = \text{FFN}_{\text{channel}}(Y) \in \mathbb{R}^{T \times Cdm} \times Cds}$ ; Reduces dimensionality of latent representations for each channel.

 $E = \operatorname{Linear}(Z) \in \mathbb{R}^{T \times C_{dm}}$ : Aggregates the features across the channel and subchannel dimensions to produce the final embedding.

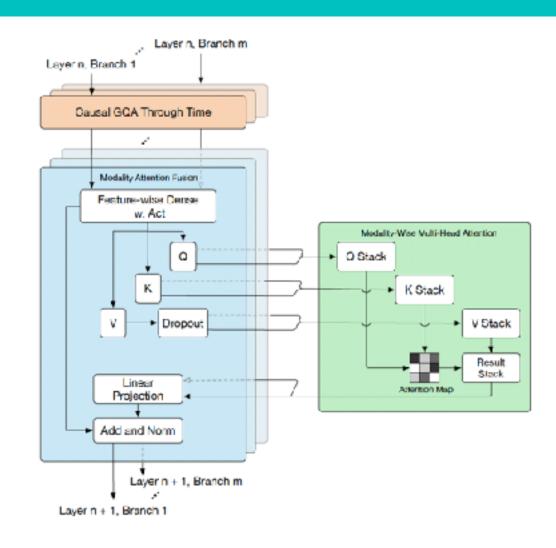

Figure 3. Repetitive Cross-modal Fusion Transformer (RCFT)

## Multi-Task Models

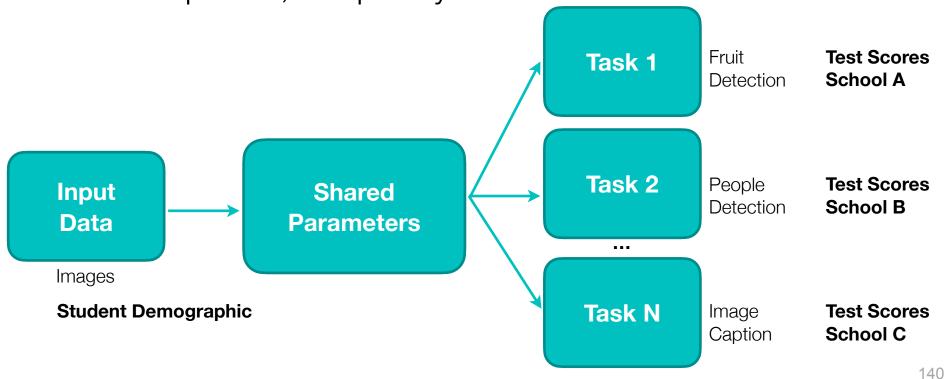

139

#### Multi-task learning overview

- For deep networks, simple idea: share parameters in early layers
- Used shared parameters as feature extractors

Train separate, unique layers for each task

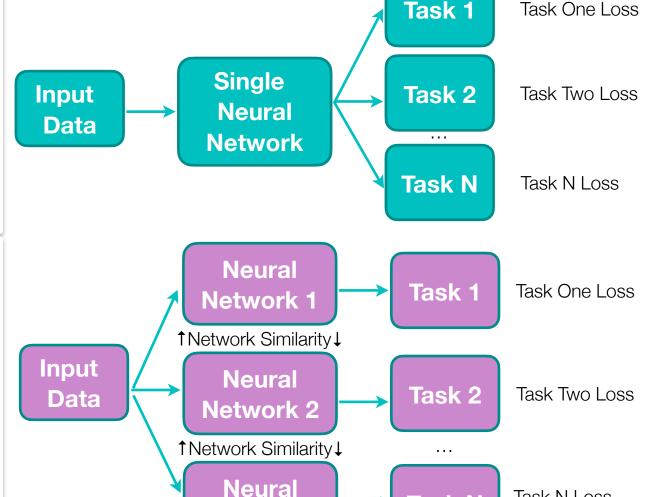

#### Multi-task Learning Parameter Sharing

Task One Loss

Task N Loss

Task N

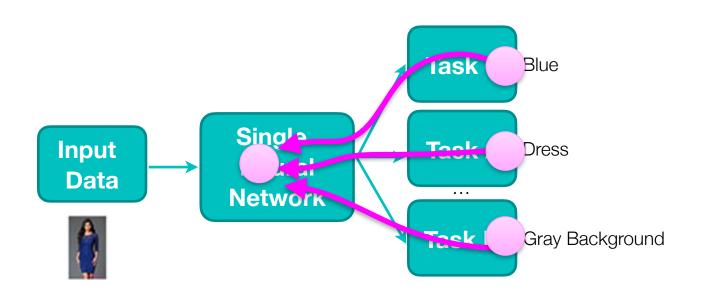

Pool Losses **Over Multiple Batches** From Multiple Tasks, **Update via BackProp** 

Pool Losses Over Multiple Batches From Multiple Tasks, Add Intra-Network **Similarity Loss** Update via BackProp

Network N

#### **Multi-task Optimization**

#### Multi-Label per Input

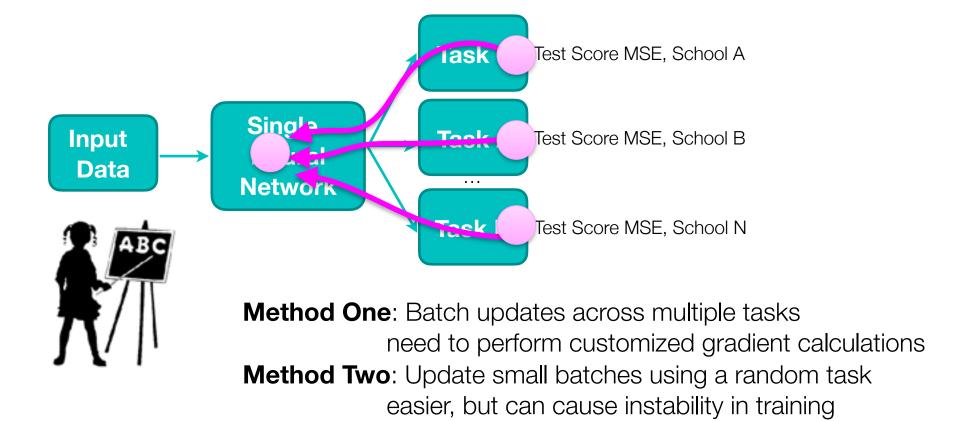

Measure Loss for each label simultaneously
Back propagate everything at one time for a given batch

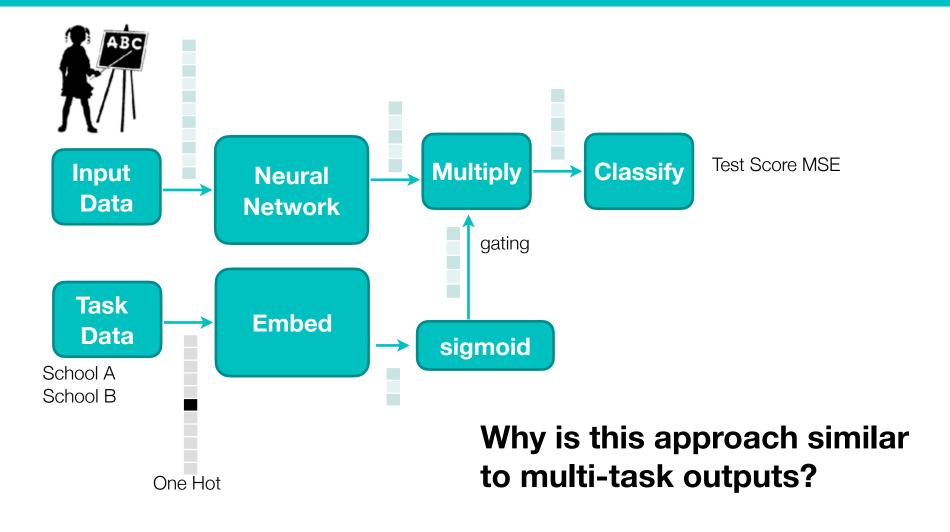

#### **Multi-task Optimization**

#### Single Task Label per Input

#### An alternative: Task-Gating
